

Project Schema Assignment

Github link to schema document:

I converted our initial representation of our database which was made in excel into a schema document following the format of the assignment.

Then we all had some pretty extensive discussion on how to make the database clearer, normalized, and representing the type of information we wanted so that it would be easy to access and easy to use.

I (along with both my teammates) contributed by helping normalize some of our tables, and converting columns that weren't initially clear into different columns that would better represent the entities and information within them.

We each contributed to providing descriptions for tables and columns for each of the tables in our database.

I also helped a lot with identifying primary and foreign keys, and which databases they needed to be linked to.

We all provided input in pretty much every decision that was made.

I helped brainstorm different ideas and situations that would help us decide how we needed to structure our database.
